EXPERIMENTATION PORTFOLIO · METRIC DESIGN

Do small wins compound? Six measured experiments, one revenue-per-visitor discipline at Evans

A portfolio of small bets across the full journey — each experience individually measured on RPV, each mechanic grounded in live behavioral data, together contributing several million pounds of top-line revenue.

OVERVIEW

A portfolio of small bets, each one measured

Evans posed a different question than its sister brands: not "what's the one big fix?" but "what do many small, individually-measured improvements add up to?" The program ran as a portfolio — six distinct experiences across the product page, basket, mobile, onboarding, and checkout — each carrying its own measured revenue-per-visitor uplift, and each grounded in live behavioral data rather than marketing assertion.

Embedded in the Arcadia ecosystem, I worked on experiences serving a customer base that was predominantly not digitally native — which made simplicity, honesty, and orientation design requirements, not niceties.

01 — THE TENSION

Three constraints that shaped the program

1 · CONVERSION RATE WASN'T ENOUGH

A conversion-only scorecard can flatter interventions that convert more people into smaller baskets. Revenue per visitor — conversion rate × average order value, collapsed into one number — holds every experience accountable for the whole commercial outcome. Choosing it was the program's first analytical decision, made before any experience shipped.

2 · AN AUDIENCE THAT PUNISHES COMPLEXITY

Evans' predominant customer base was not digitally native. Cluttered interfaces, aggressive pop-ups, and manipulative countdowns don't just underperform with this audience — they break trust. Every urgency and proof mechanic had to be simple, legible, and factually true.

3 · THE BIG-BANG TEMPTATION

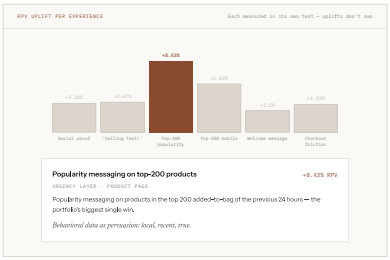

The alternative path — one dramatic redesign — concentrates risk and defies clean measurement. A portfolio of small experiences meant each idea could carry its own business case, its own test, and its own number. Small bets, honestly scored.

> *This program's edge wouldn't come from one heroic change. It would come from many modest, measured, data-grounded improvements — and from a metric strict enough to keep them all honest.*

02 — THE CRAFT

The experiment portfolio

Six experiences across four layers of the journey — every mechanic grounded in live behavioral data, every experience individually scored on RPV. Click a bar to explore each experiment.

Popularity messaging on top-200 products +8.43% RPV

URGENCY LAYER · PRODUCT PAGE

Popularity messaging on products in the top 200 added-to-bag of the previous 24 hours — the portfolio's biggest single win.

Behavioral data as persuasion: local, recent, true.

03 — IMPLEMENTATION

Rigorous execution

Every experience in the portfolio was **measured individually on RPV** — no blended program number hiding weak performers behind strong ones. An experience earned its place with its own uplift or it didn't stay.

The urgency mechanics were **factual by construction**: "selling fast" and popularity flags were computed from trailing 24-hour add-to-bag data. If a product wasn't actually moving, it carried no badge. For an audience that punishes manipulation, honest scarcity wasn't just ethics — it was retention strategy.

And the portfolio math was treated with respect: **six uplifts don't naively sum.** Experiences overlap in audience and surface, and effects interact. The program's several-million-pound contribution was assessed at the revenue line, not by adding percentages — the kind of discipline that keeps a portfolio's story credible.

04 — THE EVIDENCE

Measuring the lift

8.43%
best single experience (RPV) — popularity messaging on the top-200 added-to-bag products

6 / 6
experiences individually measured — each carried its own RPV uplift, from 2.5% to 8.43%

Millions
several million pounds added to top-line performance across the personalization program

Full journey
product page, basket, mobile, first-visit onboarding, and checkout — persuasion where it helps, simplification where it counts

> *The Arcadia measurement standard applied here as everywhere: digital investments had to drive true, incremental value — engagement, loyalty, and revenue that would not have happened anyway.*
>
> — after Simon Pritchard, Group Digital Director, Arcadia

THE GROWTH

Key learnings

Portfolios beat big bangs
Six modest, individually-measured wins compounded into millions — with less risk, faster learning, and cleaner attribution than any single redesign could offer. The deeper lesson: an experimentation program is itself a designed system, with its own metric, governance, and cadence.

The metric is the strategy
Choosing RPV over conversion rate changed what "winning" meant for every experience. Conversion can rise while revenue falls; RPV catches it. Metric selection isn't a reporting detail made after the fact — it's the first design decision, and it disciplines every one that follows.

Uplifts don't sum
The naive read of this portfolio — add six percentages, claim 26% — is wrong, and knowing why it's wrong (overlapping audiences, interacting effects, different exposure denominators) matters more than any single result. Honest aggregation is where analytical credibility is won or lost.
